

Coordinate System

Hung-yi Lee

Outline

- Coordinate Systems
 - Each coordinate system is a “*viewpoint*” for vector representation.
 - The same vector is represented differently in different coordinate systems.
 - Different vectors can have the same representation in different coordinate systems.
- Changing Coordinates
- Reference: textbook Ch 4.4

Coordinate System

Vector

$\{e_1, e_2\}$ is a coordinate system

$$\begin{bmatrix} 8 \\ 4 \end{bmatrix} = 8e_1 + 4e_2$$

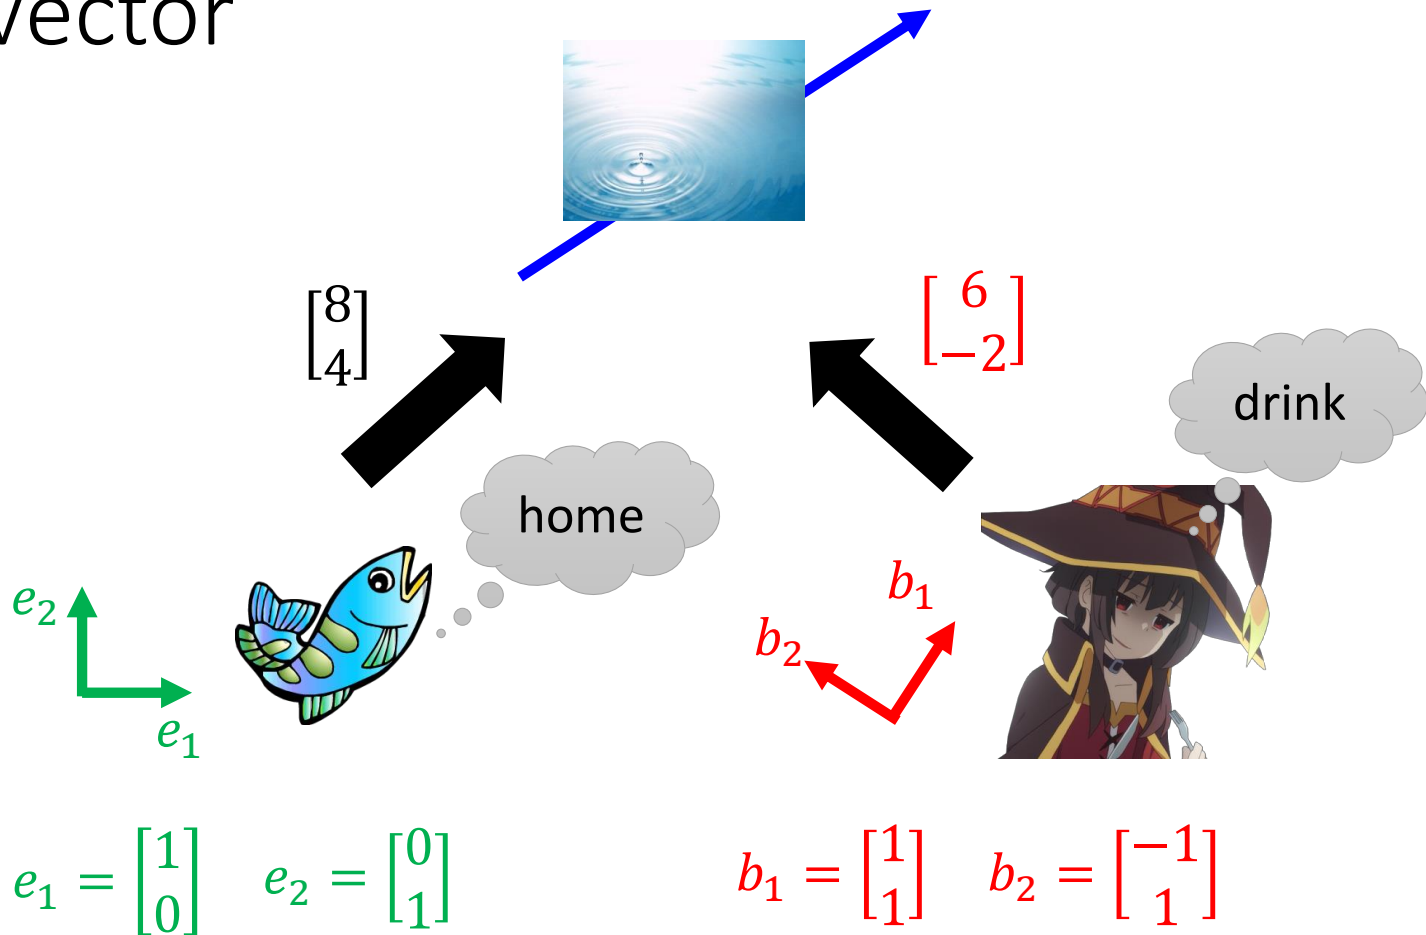

New Coordinate System

$$b_1 = \begin{bmatrix} 1 \\ 1 \end{bmatrix} \quad b_2 = \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} 8 \\ 4 \end{bmatrix} = 6b_1 + (-2)b_2$$

Vector

Vector

$$e_1 = \begin{bmatrix} 1 \\ 0 \end{bmatrix} \quad e_2 = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$$

$$b_1 = \begin{bmatrix} 2 \\ 0.5 \end{bmatrix} \quad b_2 = \begin{bmatrix} 0 \\ 0.5 \end{bmatrix}$$

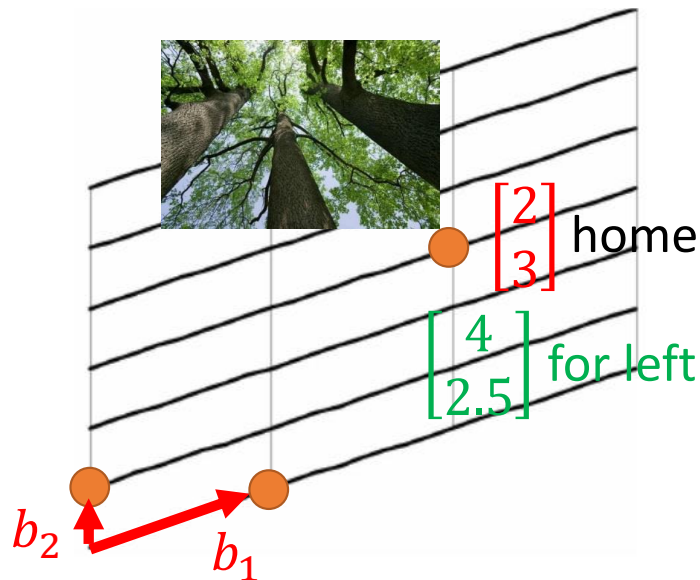

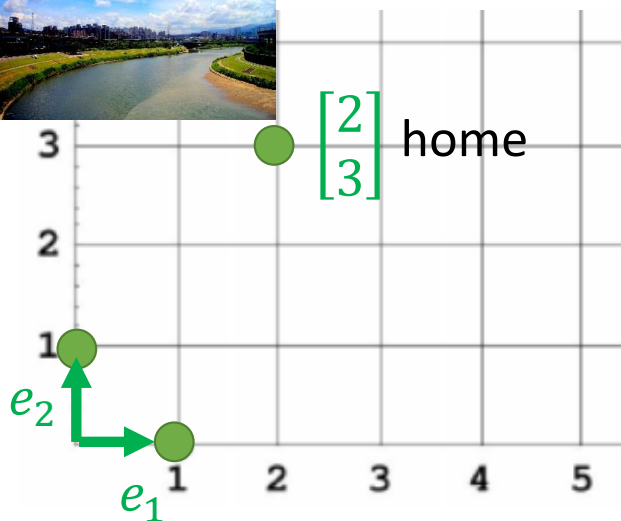

Vector

$$e_1 = \begin{bmatrix} 1 \\ 0 \end{bmatrix} \quad e_2 = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$$

$$b_1 = \begin{bmatrix} 2 \\ 0.5 \end{bmatrix} \quad b_2 = \begin{bmatrix} 0 \\ 0.5 \end{bmatrix}$$

$$2b_1 + 3b_2 = \begin{bmatrix} 4 \\ 2.5 \end{bmatrix}$$

Coordinate System

- A vector set \mathcal{B} can be considered as a coordinate system for \mathbb{R}^n if:

- 1. The vector set \mathcal{B} spans the \mathbb{R}^n

Every vector should have representation

- 2. The vector set \mathcal{B} is independent

Unique representation

\mathcal{B} is a basis of \mathbb{R}^n

Why Basis?

- Let vector set $\mathcal{B} = \{u_1, u_2, \dots, u_k\}$ be **independent**.
- Any vector v in $\text{Span } \mathcal{B}$ can be uniquely represented as a linear combination of the vectors in \mathcal{B} .
- That is, there are unique scalars a_1, a_2, \dots, a_k such that $v = a_1u_1 + a_2u_2 + \dots + a_ku_k$
- Proof:

$$\text{Unique? } v = a_1u_1 + a_2u_2 + \dots + a_ku_k$$

$$v = b_1u_1 + b_2u_2 + \dots + b_ku_k$$

$$(a_1 - b_1)u_1 + (a_2 - b_2)u_2 + \dots + (a_k - b_k)u_k = 0$$

$$\mathcal{B} \text{ is independent} \Rightarrow a_1 - b_1 = a_2 - b_2 = \dots = a_k - b_k = 0$$

Coordinate System

- Let vector set $\mathcal{B}=\{u_1, u_2, \dots, u_n\}$ be a **basis** for a subspace \mathbb{R}^n

 **\mathcal{B} is a coordinate system**

- For any v in \mathbb{R}^n , there are unique scalars c_1, c_2, \dots, c_n such that $v = c_1 u_1 + c_2 u_2 + \dots + c_n u_n$

\mathcal{B} -coordinate vector of v :

$$[v]_{\mathcal{B}} = \begin{bmatrix} c_1 \\ c_2 \\ \vdots \\ c_n \end{bmatrix} \in \mathcal{R}^n$$

(用 **\mathcal{B}** 的觀點來看原來的 v)

Coordinate System

\mathcal{E} is Cartesian coordinate system (直角坐標系)

$$v = [v]_{\mathcal{E}}$$

Other System \rightarrow Cartesian

$$\mathcal{B} = \left\{ \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 2 \\ 2 \end{bmatrix} \right\} \quad [v]_{\mathcal{B}} = \begin{bmatrix} 3 \\ 6 \\ -2 \end{bmatrix}$$

$$v = 3 \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} + 6 \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} - 2 \begin{bmatrix} 1 \\ 2 \\ 2 \end{bmatrix} = \begin{bmatrix} 7 \\ -7 \\ 5 \end{bmatrix}$$

$$\mathcal{C} = \left\{ \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}, \begin{bmatrix} 4 \\ 5 \\ 6 \end{bmatrix}, \begin{bmatrix} 7 \\ 8 \\ 9 \end{bmatrix} \right\} \quad [u]_{\mathcal{C}} = \begin{bmatrix} 3 \\ 6 \\ -2 \end{bmatrix}$$

$$u = 3 \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix} + 6 \begin{bmatrix} 4 \\ 5 \\ 6 \end{bmatrix} - 2 \begin{bmatrix} 7 \\ 8 \\ 9 \end{bmatrix} = \begin{bmatrix} 13 \\ 20 \\ 27 \end{bmatrix}$$

Other System \rightarrow Cartesian

- Let vector set $\mathcal{B} = \{u_1, u_2, \dots, u_n\}$ be a **basis** for a subspace \mathbb{R}^n
- Matrix $B = [u_1 \quad u_2 \quad \dots \quad u_n]$

Given $[v]_{\mathcal{B}}$, how to find v ? $[v]_{\mathcal{B}} = \begin{bmatrix} c_1 \\ c_2 \\ \vdots \\ c_n \end{bmatrix}$

$$v = c_1 u_1 + c_2 u_2 + \dots + c_n u_n$$

$$= B[v]_{\mathcal{B}} \quad (\text{matrix-vector product})$$

Cartesian \rightarrow Other System

$$v = \begin{bmatrix} 1 \\ -4 \\ 4 \end{bmatrix} \quad \mathcal{B} = \left\{ \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 2 \\ 2 \end{bmatrix} \right\} \quad \text{find } [v]_{\mathcal{B}}$$

$$c_1 \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} + c_2 \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} + c_3 \begin{bmatrix} 1 \\ 2 \\ 2 \end{bmatrix} = \begin{bmatrix} 1 \\ -4 \\ 4 \end{bmatrix} \quad [v]_{\mathcal{B}} = \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix}$$

$$B = \begin{bmatrix} 1 & 1 & 1 \\ 1 & -1 & 2 \\ 1 & 1 & 2 \end{bmatrix} \quad B \text{ is invertible (?)}$$

independent

$$B[v]_{\mathcal{B}} = v \quad \longrightarrow \quad [v]_{\mathcal{B}} = B^{-1}v = \begin{bmatrix} -6 \\ 4 \\ 3 \end{bmatrix}$$

Cartesian \leftrightarrow Other System

- Let $\mathcal{B} = \{\mathbf{b}_1, \mathbf{b}_2, \dots, \mathbf{b}_n\}$

$$\begin{array}{ccc} & [v]_{\mathcal{B}} = B^{-1}v & \\ & \xrightarrow{\hspace{10em}} & \\ v & & [v]_{\mathcal{B}} \\ & \xleftarrow{\hspace{10em}} & \\ & v = B[v]_{\mathcal{B}} & \\ & = c_1\mathbf{b}_1 + c_2\mathbf{b}_2 + \dots + c_n\mathbf{b}_n & = \begin{bmatrix} c_1 \\ c_2 \\ \vdots \\ c_n \end{bmatrix} \end{array}$$

Let $\mathcal{B} = \{b_1, b_2, \dots, b_n\}$ be a basis of \mathbb{R}^n . $[b_i]_{\mathcal{B}} = ? e_i$

(Standard vector)

Changing Coordinates

Equation of ellipse

$$\frac{x^2}{3^2} + \frac{y^2}{2^2} = 1$$

?

Equation of ellipse

Use another coordinate system

$$\mathcal{B} = \left\{ \begin{bmatrix} \frac{\sqrt{2}}{2} \\ \frac{\sqrt{2}}{2} \end{bmatrix}, \begin{bmatrix} -\frac{\sqrt{2}}{2} \\ \frac{\sqrt{2}}{2} \end{bmatrix} \right\}$$

$$\mathbf{v} = \begin{bmatrix} x \\ y \end{bmatrix}, [\mathbf{v}]_{\mathcal{B}} = \begin{bmatrix} x' \\ y' \end{bmatrix}$$

What is the equation of the ellipse
in the new coordinate system?

$$\frac{(x')^2}{3^2} + \frac{(y')^2}{2^2} = 1$$

Equation of ellipse

$$\mathbf{v} = \begin{bmatrix} x \\ y \end{bmatrix}, \quad [\mathbf{v}]_{\mathcal{B}} = \begin{bmatrix} x' \\ y' \end{bmatrix} \quad \mathcal{B} = \left\{ \begin{bmatrix} \frac{\sqrt{2}}{2} \\ \frac{\sqrt{2}}{2} \end{bmatrix}, \begin{bmatrix} -\frac{\sqrt{2}}{2} \\ \frac{\sqrt{2}}{2} \end{bmatrix} \right\}$$

$$\frac{(x')^2}{3^2} + \frac{(y')^2}{2^2} = 1 \Rightarrow \frac{\left(\frac{\sqrt{2}}{2}x + \frac{\sqrt{2}}{2}y\right)^2}{3^2} + \frac{\left(-\frac{\sqrt{2}}{2}x + \frac{\sqrt{2}}{2}y\right)^2}{2^2} = 1$$

$$[\mathbf{v}]_{\mathcal{B}} = B^{-1}\mathbf{v}$$

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = B^{-1} \begin{bmatrix} x \\ y \end{bmatrix}$$

Equation of hyperbola

$$-\sqrt{3}x^2 + 2xy + \sqrt{3}y^2 = 12$$

equation?

Equation of hyperbola

$$B = [b_1 \quad b_2]$$

$$-\sqrt{3}x^2 + 2xy + \sqrt{3}y^2 = 12$$

$$b_1 = \begin{bmatrix} \frac{\sqrt{3}}{2} \\ \frac{1}{2} \\ \frac{1}{2} \end{bmatrix} \quad b_2 = \begin{bmatrix} -\frac{1}{2} \\ \frac{\sqrt{3}}{2} \\ \frac{1}{2} \end{bmatrix}$$

$$v = \begin{bmatrix} x \\ y \end{bmatrix} \quad [v]_{\mathcal{B}} = \begin{bmatrix} x' \\ y' \end{bmatrix} \quad v = B[v]_{\mathcal{B}}$$

$$\begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} \frac{\sqrt{3}}{2} & -\frac{1}{2} \\ \frac{1}{2} & \frac{\sqrt{3}}{2} \end{bmatrix} \begin{bmatrix} x' \\ y' \end{bmatrix}$$

Equation of hyperbola

$$B = [b_1 \quad b_2]$$

$$-\sqrt{3}x^2 + 2xy + \sqrt{3}y^2 = 12$$

$$x = \frac{\sqrt{3}}{2}x' - \frac{1}{2}y'$$

$$y = \frac{1}{2}x' + \frac{\sqrt{3}}{2}y'$$

$$b_1 = \begin{bmatrix} \frac{\sqrt{3}}{2} \\ \frac{1}{2} \\ \frac{1}{2} \end{bmatrix} \quad b_2 = \begin{bmatrix} -\frac{1}{2} \\ \frac{\sqrt{3}}{2} \\ \frac{1}{2} \end{bmatrix}$$

$$v = \begin{bmatrix} x \\ y \end{bmatrix} \quad [v]_{\mathcal{B}} = \begin{bmatrix} x' \\ y' \end{bmatrix} \quad v = B[v]_{\mathcal{B}}$$

$$x'y' = 3$$

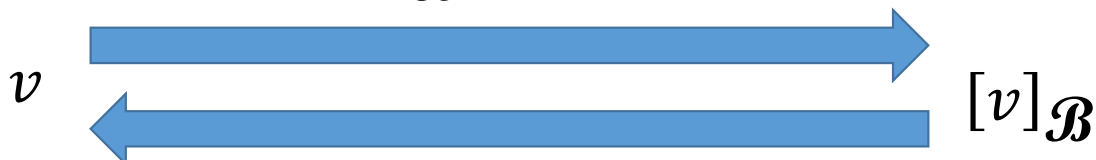

$$\begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} \frac{\sqrt{3}}{2} & -\frac{1}{2} \\ \frac{1}{2} & \frac{\sqrt{3}}{2} \end{bmatrix} \begin{bmatrix} x' \\ y' \end{bmatrix}$$

Summary

vector $\longrightarrow \mathcal{B} = \{u_1, u_2, \dots, u_n\}$

$[v]_{\mathcal{B}}$

vector $\longrightarrow \mathcal{E} = \{e_1, e_2, \dots, e_n\}$
(standard vectors)

$$[v]_{\mathcal{B}} = B^{-1}v$$

$$v = B[v]_{\mathcal{B}}$$
