## Equivalent

 Two systems of linear equations are equivalent if they have exactly the same solution set.

## Equivalent

- Applying the following three operations on a system of linear equations will produce an equivalent one.
- 1. Interchange

$$\begin{cases} 3x_1 + x_2 = 10 \\ x_1 - 3x_2 = 0 \end{cases} = \begin{cases} x_1 - 3x_2 = 0 \\ 3x_1 + x_2 = 10 \end{cases}$$

• 2. Scaling

$$\begin{cases} 3x_1 + x_2 = 10 \\ x_1 - 3x_2 = 0 \text{ X(-3)} \end{cases} \longrightarrow \begin{cases} 3x_1 + x_2 = 10 \\ -3x_1 + 9x_2 = 0 \end{cases}$$

• 3. Row Addition

$$\begin{cases} 3x_1 + x_2 = 10 \\ x_1 - 3x_2 = 0 \text{ X(-3)} \end{cases} = \begin{cases} 10x_2 = 10 \\ x_1 - 3x_2 = 0 \end{cases}$$

## Solving system of linear equation

- Two systems of linear equations are equivalent if they have exactly the same solution set.
- Strategy:

$$\begin{cases} x_1 & -3x_2 = 0 \\ 3x_1 & +x_2 = 10 \end{cases} \begin{cases} x_1 & -3x_2 = 0 \\ 10x_2 & = 10 \end{cases} \begin{cases} x_1 & -3x_2 = 0 \\ x_2 & = 1 \end{cases} \begin{cases} x_1 & = 3 \\ x_2 & = 1 \end{cases}$$

We know how to transform the given system of linear equations into another equivalent system of linear equations.

We do it again and again until the system of linear equation is so simple that we know its answer at a glance.

## Augmented Matrix

## Solving system of linear equation

- Two systems of linear equations are equivalent if they have exactly the same solution set.

A matrix can be transformed into multiple REF by row operation, but only one RREF

The pivot positions of A are (1,1), (2,3) and (3,4).

The pivot columns of A are 1<sup>st</sup>, 3<sup>rd</sup> and 4<sup>th</sup> columns.

 A system of linear equations is easily solvable if its augmented matrix is in reduced row echelon form

#### **Example 1. Unique Solution**

$$\begin{bmatrix} x_1 & x_2 & x_3 & b \\ 1 & 0 & 0 & -4 \\ 0 & 1 & 0 & -5 \\ 0 & 0 & 1 & 3 \end{bmatrix} \qquad x_1 = -4$$

$$x_2 = -5$$

$$x_3 = 3$$
If RREF looks
like  $\begin{bmatrix} I & \mathbf{b}' \end{bmatrix}$ 
unique solution

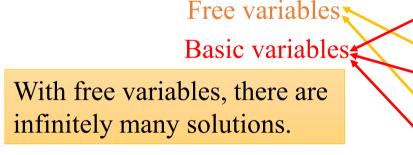

#### **Example 2. Infinite Solution**

$$\begin{bmatrix} x_1 & x_2 & x_3 & x_4 & x_5 & b \\ 1 & -3 & 0 & 2 & 0 & 7 \\ 0 & 0 & 1 & 6 & 0 & 9 \\ 0 & 0 & 0 & 0 & 1 & 2 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix} \qquad x_1 - 3x_2 + 2x_4 = 7$$

$$x_3 + 6x_4 = 9$$

$$x_5 = 2$$

$$0 = 0$$

#### Parametric Representation:

$$\begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \\ x_5 \end{bmatrix} = \begin{bmatrix} 7 + 3x_2 - 2x_4 \\ 9 - 6x_4 \\ 2 \end{bmatrix}$$

#### Example 3. No Solution

When an augmented matrix contains a row in which the only nonzero entry lies in the last column

- RREF of a matrix is unique.
